

Task 3: Hosting a Simple Web Application

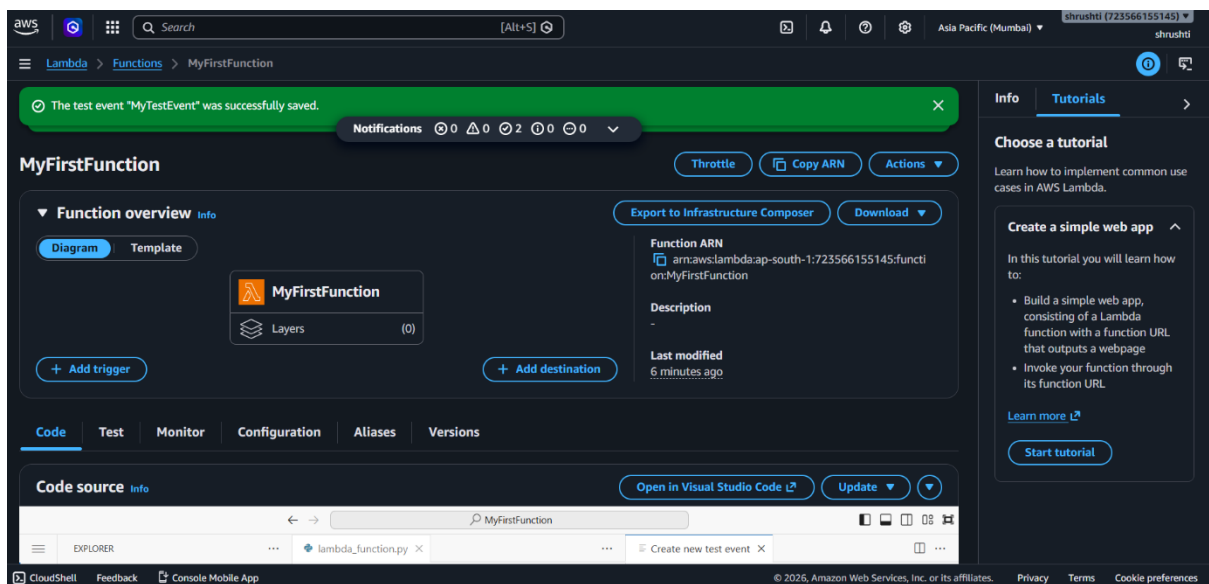

Objective:

To host a custom website on your configured AWS EC2 instance and ensure it is accessible via the internet using a public IP address.

Step 1: System Update

Connect to your EC2 instance via SSH terminal.

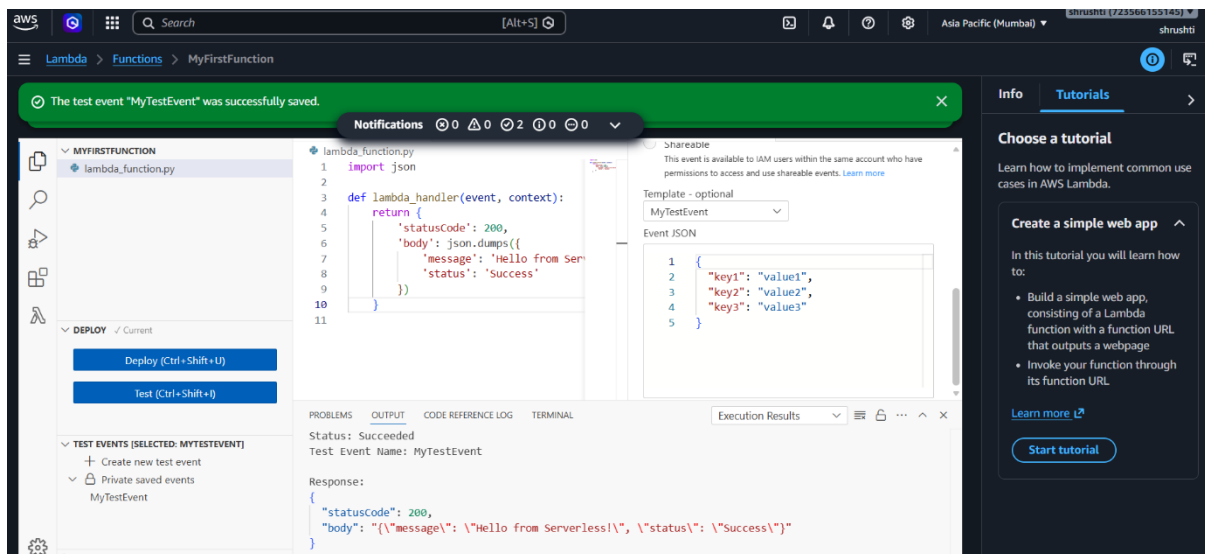

Execute the command `sudo apt update` to ensure your Ubuntu system repository lists are up-to-date and all security patches are recognized.

Step 2: Installing the Web Server

Install the Apache web server package by running the command `sudo apt install apache2`.

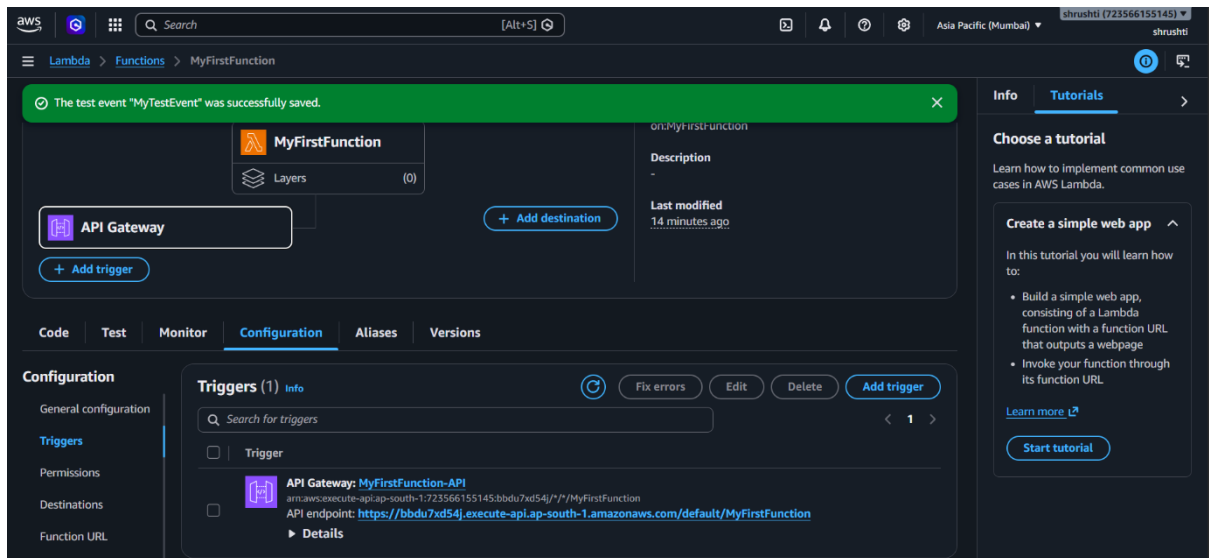

Verify that the Apache service is installed and ready to be initialized.

Step 3: Service Management

Start the Apache web server service using the command `sudo systemctl start apache2`.

Ensure the service is configured to handle incoming web traffic on port 80.

Step 4: Web Content Deployment

Locate the web root directory at `/var/www/html/`.

Create or update your `index.html` file within this directory to serve your custom website content.
