
INTERNSHIP PROJECT REPORT

TOPIC : Cloud Infrastructure Deployment on AWS

Submitted in partial fulfillment of the requirements for the Internship
Program at Internspark

Project Title: Implementation of Serverless Architecture
and Containerized Web Services on AWS

Intern Name: Shrushti V.M

Intern ID: IS-2026-9365

Domain: Cloud Computing Intern

Project Mentor: Akash Dubey

Organization: Internspark

Task 1

Deploy a Static Website on AWS S3

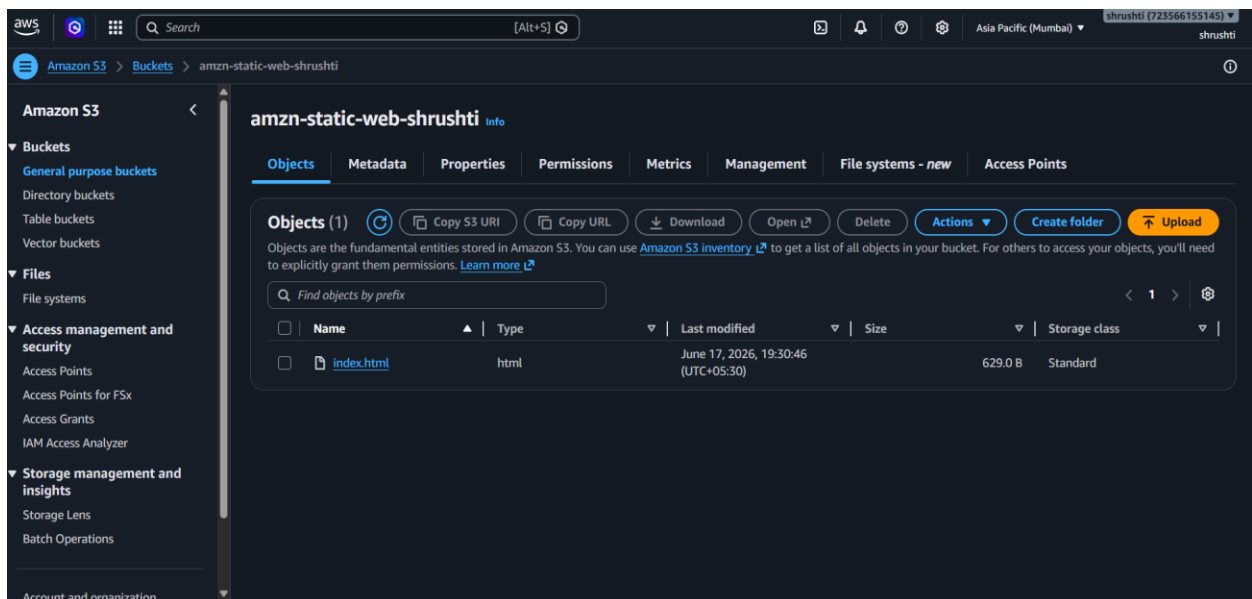

OBJECTIVE:

“The primary goal of this task is to host a static website using Amazon S3 (Simple Storage Service), to provision a secure and scalable AWS S3 bucket for cloud storage and static content management.

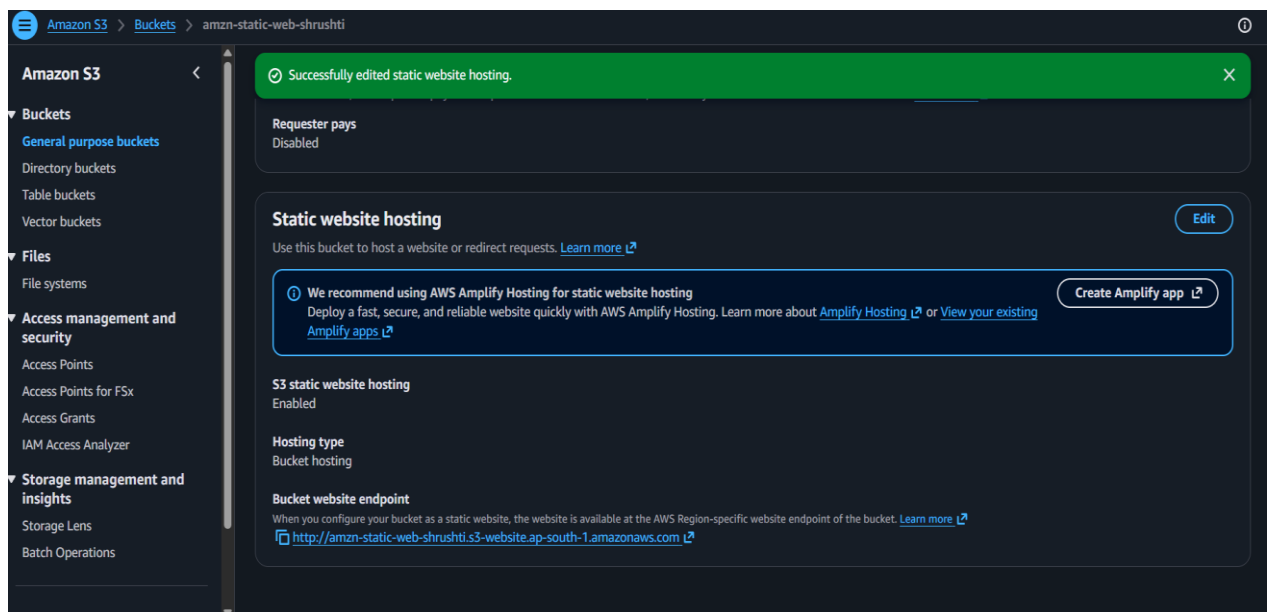

STEPS PERFORMED:

STEP1: S3 Dashboard Navigation: Accessed the Amazon S3 service through the AWS Management Console.

Service & Navigation: Navigated to the Amazon S3 (Simple Storage Service) dashboard within the AWS Management Console to initiate the resource provisioning process.

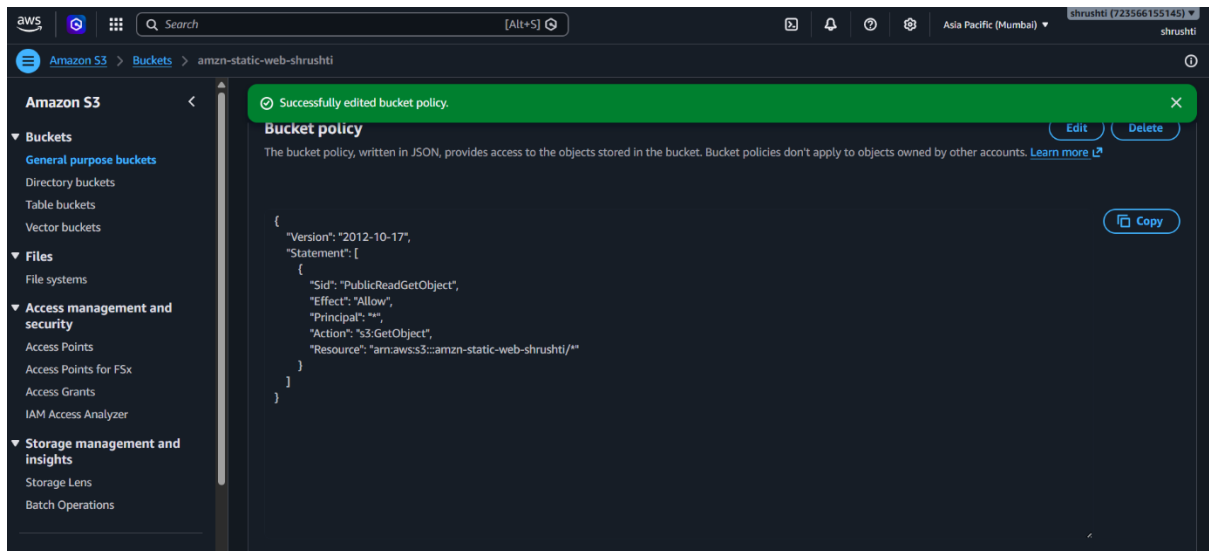

STEP2: Bucket Creation: Initiated the "Create bucket" process and defined a unique bucket name. Bucket Naming & Region Selection: Defined a globally unique bucket name following standard naming conventions. Selected the [Insert your Region, e.g., Asia Pacific (Mumbai) ap-south-1] region to minimize latency and ensure data residency compliance.

STEP3: Region Selection: Selected the appropriate AWS Region ([insert your region, e.g., Asia Pacific - Mumbai]) to ensure optimal latency.

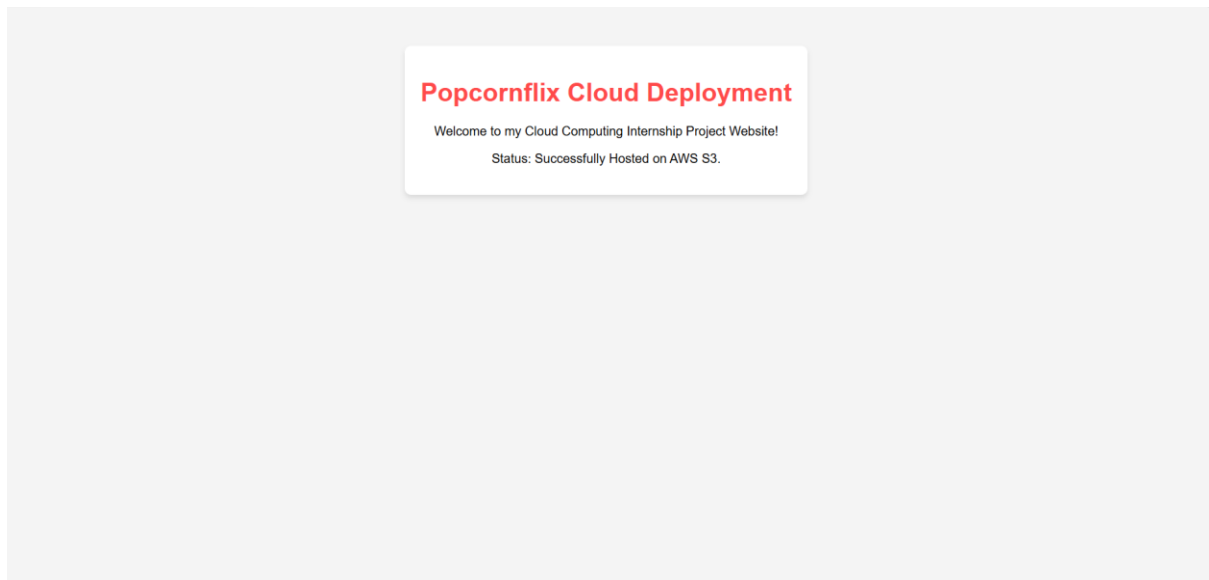

Security & Access Policy Configuration:

Configured the "Block Public Access" settings based on project requirements. Carefully reviewed and disabled "Block all public access" for the specific use case of hosting static content, ensuring that only necessary permissions were granted to maintain the principle of least privilege.

STEP4: Bucket Property Setup:

Configured bucket properties, including versioning (to enable data recovery and historical tracking) and default encryption settings to ensure data at rest is protected.

STEP5: Final Validation:

Verified the bucket creation by reviewing the S3 console.
Confirmed the bucket's accessibility and integrity by uploading a test file and verifying its visibility.

The task was successfully completed. The website is now hosted on a serverless architecture using AWS S3, ensuring high availability and low cost.
